One tool call, before and after the tool-call repair

Base gpt-oss-120b, control env test_cases_parent_dir (row 284, sample 0, turn 24). The harness, not the model, made the submitted file invalid Python.

1 What the model sampled (JSON tool-call arguments)

```
{"command":"cat > my_solution.py << 'PY'\n
from math import gcd\nfrom typing import List\nMOD = 10**9 + 7\n …
    print(count_subsequence_pairs([1, 1, 1, 1])) # expected 50\n
PY"]}       ← opened as a string, closed as an array ( "]} ): invalid JSON. 53% of the baseline's heredoc calls end like this.
```

Before: the fork's salvage

2 Command sent to the sandbox

```
cat > my_solution.py << 'PY'
…
    print(count_subsequence_pairs([1, 1, 1, 1])) # expected 50
PY"]}
```

PY"]} is not the terminator PY, so the heredoc runs on to the end of the sandbox's wrapper script (bash: "here-document delimited by end-of-file").

3 End of my_solution.py as graded

```
    return ans

if __name__ == "__main__":
    print(count_subsequence_pairs([1, 2, 3, 4]))   # expected 10
    print(count_subsequence_pairs([1, 1, 1, 1])) # expected 50
PY"]}

__exit_code=$?
pwd > "/home/agent_028d023b/.session_cwd"
export -p > "/home/agent_028d023b/.session_env.new" && mv …
exit $__exit_code
```

Grader: SyntaxError: unterminated string literal (line 44) → reward −5

Now: exact JSON decode (tool_call_repair.py)

2 Command sent to the sandbox

```
cat > my_solution.py << 'PY'
…
    print(count_subsequence_pairs([1, 1, 1, 1])) # expected 50
PY
```

Read up to the string's real closing quote; the broken ending "]} is ignored. The heredoc closes and the wrapper runs normally.

3 End of my_solution.py as graded

```
    return ans

if __name__ == "__main__":
    print(count_subsequence_pairs([1, 2, 3, 4]))   # expected 10
    print(count_subsequence_pairs([1, 1, 1, 1])) # expected 50
```

File holds only the model's code; graded on what it wrote

Across the 512-episode baseline (4,654 tool calls replayed through the fork's VerlEnv, nothing executed): commands with an unclosed heredoc 941 → 32, episodes affected 261 → 25. Before the fix, 125 of the 240 coding failures submitted a file containing these wrapper lines.
